How to read this book

Every demonstration is a numbered Specimen. Its label — set in the outside margin, on the Annotations layer, under the Spec-Notes condition — names the wire op, property path, or registry row it proves. Hide Spec-Notes and the ledger becomes a clean annual; show it and every page cites its own evidence demonstrated in full ·  demonstrated to a recorded limit, with a margin note pointing at Appendix A ·  not modelled by declaration, listed only in the appendix. Nothing on any page pretends.ce.

Foreword

A capability that cannot be demonstrated in a document is a claim, not a capability. This volume to close that distance: every op the wire declares, every property the catalog names, every platform carries, shown in a page a reader can hold.

The pages that follow are not screenshots and not mockups. They were authored over the session channel the editor's own panels use, against the same engine that renders them, and saved in the same container this file is. Where a limit exists, it is printed. Where a lane is partial, the margin shows.

What survives here is what the system can actually do.
